

INSTRUCTIONS

- You have 2 hours to complete the exam individually.
- The exam is closed book, closed notes, closed computer, and closed calculator, except for one hand-written 8.5" × 11" crib sheet of your own creation.
- Mark your answers **on the exam itself**. We will *not* grade answers written on scratch paper.

POLICIES & CLARIFICATIONS

- You may use built-in Python functions that do not require import, such as `min`, `max`, `pow`, and `abs`.
- For fill-in-the blank coding problems, we will only grade work written in the provided blanks. You may only write one Python statement per blank line, and it must be indented to the level that the blank is indented.
- Unless otherwise specified, you are allowed to reference functions defined in previous parts of the same question.

1. (11 points) No Capes!

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. Each expression has at least one line of output.

- If an error occurs, write **ERROR**, but include all output displayed before the error.
- To display a function value, write **FUNCTION**.
- If an expression would take forever to evaluate, write **FOREVER**.

The interactive interpreter displays the value of a successfully evaluated expression, unless it is **None**.

Assume that you have started `python3` (not `ipython` or other variants) and executed the code shown on the left first, then you evaluate each expression on the right in the order shown. Expressions evaluated by the interpreter have a cumulative effect.

Expression	Interactive Output
<code>print(4, 5) + 1</code>	4 5 ERROR
<code>incredible / dash</code>	
<code>el(mr, 4, 0)</code>	
<code>sam = fro(zen)</code>	
<code>edna(sam, 7)</code>	
<code>vi(dash, incredible)</code>	
<code>vi(jack, dash)</code>	

```

1 mr, incredible = 13, 21
2
3 def el(ast, i, girl):
4     if ast > i or i / girl:
5         print('stretch')
6     return incredible
7
8 zen = 7
9
10 def fro(zone):
11     def where(is_my):
12         print('supersuit')
13         return is_my + 2
14     print(zone + zen)
15     return where
16
17 dash = 4
18
19 def edna(mo, de=4):
20     jack = 5
21     if de // 3 < 2:
22         return zen
23     return mo(jack) + dash
24
25 jack = lambda jack: edna(jack)
26
27 def vi(o, let):
28     if let % 3:
29         return o(3)
30     print('hidden')
31     return vi(print, let + 2)

```

2. (10 points) Dog Days

Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. *You may not need to use all of the spaces or frames.*

A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

Global frame	
pet "dog"	
bug 3	
to _____	→ func to(do) [parent=Global]
walk _____	→ func walk(time) [parent=Global]
f1: _____ [parent: _____]	
_____ _____

f3: _____ [parent: _____]	
_____ _____	
_____ _____	
Return Value _____	
f4: _____ [parent: _____]	
_____ _____	
_____ _____	
_____ _____	
Return Value _____	
f5: _____ [parent: _____]	
_____ _____	
_____ _____	
_____ _____	
Return Value _____	

```

1 pet = "dog"
2 bug = 3
3
4 def to(do):
5     bug = 5
6     if do == "sleep":
7         return "zzz"
8         return lambda bye: bye - bug
9
10 def walk(time):
11     pet = "cat"
12     bed = time()
13     if not bed(bug):
14         return to("sleep")
15     else:
16         return (lambda: "itch")()
17
18 walk(lambda: (to(pet) or not 2*pet))

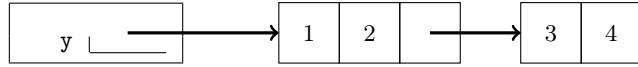

```

3. (7 points) List-Man and the Box

Draw box-and-pointer diagrams for the state of the lists after executing each block of code below. You don't need to write index numbers or the word "list". Please erase or cross out any boxes or pointers that are not part of a final diagram.

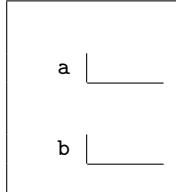

An example is given below:

```
1  y = [1, 2, [3, 4]]
```

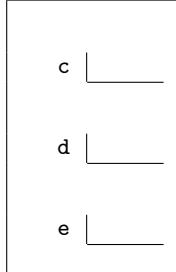

(a) (2 pt)

```
1  a = [1, 2, 3]
2  b = [4, 5, 6]
3  a.insert(a[0], b)
4  b.pop(a.pop(1))
```

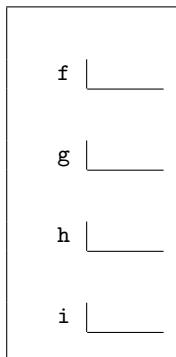

(b) (2 pt)

```
1  c = [1, 2, 3]
2  d = [4, c, 6, 7]
3  e = [d[x] for x in c]
4  d.append(e)
```

(c) (3 pt)

```
1  f, h = [1], [2]
2  f.extend([h, 3])
3  g = f[1:] + f[1:]
4  i = 0
5  while i < len(f):
6      if i % 2 == 0:
7          h.append(g[f[i]])
8      i += 1
```

4. (6 points) Book Club

- (a) (2 pt) A function is a higher order function if it has at least one of two particular properties. What are those two properties?

1. _____

2. _____

- (b) (2 pt) Give one reason why you shouldn't violate abstraction barriers. Limit your answer to 15 words or less.

- (c) (2 pt) What's a difference between tuples and lists besides syntax? Limit your answer to 10 words or less.

5. (6 points) Won't You Be My Neighbor?

- (a) (4 pt) Write `repeat_digits`, which takes a positive integer `n` and returns another integer that is identical to `n` but with each digit repeated.

```
def repeat_digits(n):
    """Given a positive integer N, returns a number with each digit repeated.

    >>> repeat_digits(1234)
    11223344
    """
    last, rest = _____, _____
    if _____:
        return _____
    return _____(_____ * _____ + _____)
```

- (b) (2 pt) Let d be the number of digits in `n`. What is the runtime of `repeat_digits` with respect to d ?

$\Theta(1)$ $\Theta(\log d)$ $\Theta(\sqrt{d})$ $\Theta(d)$ $\Theta(d^2)$ $\Theta(2^d)$

6. (6 points) Ocean's Eight

Write `eight_path`, which takes in a tree `t` and returns a list of labels following a path from the top of the tree (the root) to a leaf whose sum is divisible by 8. If there are multiple such paths, return the leftmost one. If there is no such path, return `None`.

The tree data abstraction is provided here for your reference. Do not violate the abstraction barrier!

```
def tree(label, branches=[]):
    return [label] + list(branches)

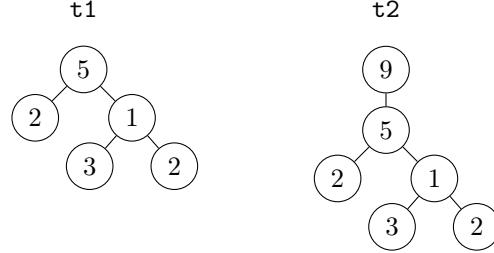

def label(t):
    return t[0]

def is_leaf(t):
    return not branches(t)

def branches(t):
    return t[1:]

def eight_path(t):
    """Returns a path of the labels from the root to a leaf whose sum is a multiple of eight,
    or return None if no path exists.

    >>> t1 = tree(5, [tree(2),
                      tree(1, [tree(3),
                                tree(2)]))
    >>> eight_path(t1)
    [5, 1, 2]
    >>> t2 = tree(9, [t1])
    >>> eight_path(t2)
    [9, 5, 2]
    """
    def helper(t, path_so_far):
        -----
        if _____:
            return path_so_far
        for _____:
            result = _____
            if result:
                return _____
        return _____
```

7. (6 points) Never Tell Me The Odds

Han and Lando are playing a game of Sabacc. The rules are as follows:

- Two players take turns drawing from a deck of cards
- Each turn, players can choose to draw either 1 or 2 cards
- A player wins when there are no cards left at the start of their turn.

Han and Lando are both very good at the game, so they play *optimally*. That is, if there is a move they can take that will allow them to win (assuming their opponent also plays optimally), they will take it.

Write `sabacc_winner`, which takes a number of cards and two players, and returns the winner if both players play optimally and player 0 goes first.

You *must* use recursion to solve this problem. Writing the closed-form solution will receive no credit.

```
def sabacc_winner(cards, player0, player1):
    """Returns the winner of a game of Sabacc if players can take 1 or 2 cards
    per turn and both players play optimally. Assume that it is player0's turn.

    >>> sabacc_winner(0, 'Han', 'Lando')
    'Han'
    >>> sabacc_winner(1, 'Han', 'Lando')
    'Lando'
    >>> sabacc_winner(2, 'Han', 'Lando')
    'Han'
    >>> sabacc_winner(3, 'Han', 'Lando')
    'Han'
    >>> sabacc_winner(4, 'Han', 'Lando')
    'Lando'
    """
    if _____:
        return player0

    if _____:
        return player1

    _____ = _____
    _____ = _____

    if _____:
        return player0

    return player1
```

8. (8 points) Mr. Stark, I Don't Feel So Good

A *messenger function* is a function that takes a single word and returns another messenger function, until a period is provided as input, in which case a sentence containing the words provided is returned. At least one word must be provided before the period.

As an example, here's a simple messenger function that returns a sentence with all of the words that have been provided.

```
>>> simple_messenger("Avengers")("assemble")(".")
'Avengers assemble.'
>>> simple_messenger("Get")("this")("man")("a")("shield")(".")
'Get this man a shield.'
```

Write `thanos_messenger`, which is a messenger function that discards every other word that's provided. The first word should be included in the final sentence, the second word should be discarded, and so on.

```
def thanos_messenger(word):
    """A messenger function that discards every other word.

    >>> thanos_messenger("I")("don't")("feel")("so")("good")(".")
    'I feel good.'
    >>> thanos_messenger("Thanos")("always")("kills")("half")(".")
    'Thanos kills.'
    """
    assert word != '.', 'No words provided!'

def make_new_messenger(message, skip_next):

    def new_messenger(word):

        if word == '.':
            return _____
        if _____:
            return _____
        return _____
        return _____
        return _____
        return _____
        return _____
```

9. (0 points) Your Mission, Should You Choose To Accept It

In this extra credit problem, you may choose one of two options.

- Mark the choice to “Betray” and write a positive integer in the blank below. The one student who writes the *smallest, unique positive integer* will receive *two* (2) extra credit points but only if fewer than 90% of students choose the next option.
- Mark the choice to “Work Together”. If at least 90% of students choose this option, all students who chose this option will receive *one* (1) extra credit point and those who marked the choice to “Betray” will receive zero (0) extra credit points.

Will you *work together*? Or will you *betrax* your fellow students? It is up to you.

Betray _____

Work Together

10. (0 points) I've Been Waiting For You

If you finish early, please stay in your seat until time is up and we are ready to move on to the group section. After you've reviewed your work, if you have extra time, you can try this challenge problem while you wait (not for credit). Work on this problem quietly until the individual section is over. We will not accept questions on this problem.

- (a) (0 pt) Implement `lcs`, which finds the length of the longest common subsequence between two words. Note that the ordering of the characters must be preserved.

```
def lcs(word1, word2):
    """ Finds the length of the longest common subsequence between two words.
    >>> lcs("water", "loo")
    0
    >>> lcs("mamma", "mia") # ma
    2
    >>> lcs("super", "trouper") # uper
    4
    """
    if _____:
        return _____
    elif _____:
        return _____
    return _____
```

- (b) (0 pt) What is the runtime (in the worst case) of `lcs`? By *worst case*, we mean we want you to consider inputs that would be particularly time consuming for `lcs`.

- (c) (0 pt) Now, implement `lcs_fast` which does the same thing as `lcs`, but has a time complexity of $\Theta(m * n)$, where m is the number of characters in `word1` and n is the number of characters in `word2`.

```
def lcs_fast(word1, word2):
```

- (d) (0 pt) Provide a high-level proof as to why the runtime of your implementation of `lcs_fast` is $\Theta(m * n)$.

11. (0 points) Terminal

Done? Still need something to do?

- (a) (0 pt) Can you name the movie coming out / already released this summer that each problem title is referencing?

1. _____	5. _____	9. _____
2. _____	6. _____	10. _____
3. _____	7. _____	11. _____
4. _____	8. _____	

- (b) (0 pt) Any feedback for us on how this exam went / how the course is going so far?
